Directly relevant to smart city traffic management, navigation apps (Google Maps/Waze-style systems), fuel-efficiency and emission reduction, and intelligent transportation systems (ITS).

B. Assignment Problem / Challenge

Rapid urbanization and the steady rise in the number of vehicles have made traffic congestion one of the most pressing challenges for cities today. Congestion leads to increased travel time, higher fuel consumption, elevated vehicular emissions, and considerable economic loss. Conventional navigation systems largely rely on static road distances or, at best, present-moment traffic snapshots, and therefore fail to anticipate how congestion will evolve over the course of a trip.

This assignment requires the team to design and implement an Artificial Intelligence based system that (a) predicts near-future traffic congestion levels / travel times on individual road segments using historical and time-based traffic patterns, and (b) uses these predictions to recommend the most efficient route between a given source and destination, going beyond simple shortest-distance routing.
